Part - I

1) Photosynthesis is process by which plants makes food

2) Cholorophyll is a green pigment found in plants, algae and some bacteria

3) Mitochondria is a power of the cell

4) A tissue is a group of similar cell

5) Roots absorb water and minerals from the soil

6) Transpiration is the process by which plants lose water in the form of water vapour

7) An ecosystem is a community of living organism interacting with each other

8) An habitat is the natural environment or place where an organism lives, grows and reproduces. and its

Types are Terrestial Habitat and Aquatic Habitat

9) A unicellular organism is a living organism made up of a single cell that performs all life

10) Pollination is the tranfer of pollen grains from the another to the stigma of a flower, Amoeba

11) Photosynthesis is the process by which Absorption of sunlight and water and Intake of Carbon di-oxide (CO_2)

12) Plants can make their own food by photosynthesis and usually do not move, while animals cannot make their own food and can move

13) Leaf has their main parts : Leaf, petiole and lamina

14) Nutrients are substances in food that provide energy, growth, repair and proper functioning of the body. Types are Carbohydrates, Proteins, fats and vitamins

15) Water is essential for plants as it help in photosynthesis transport of nutrients and maintaining cell turgidity.
